Use the supermarket receipts. Find items on the list that were on special when purchased and calculate the percentage saved from the full price and amount saved. You can use a calculator to help but make sure you check that the answers you have got are reasonable.

Create a table, similar to the example below, showing the full price, savings and the percentage reduction you have calculated. Use it to work out the overall percentage saved in the whole supermarket bill. To do this you will need to work out the total amount spent and the total amount saved.

Example:

Item	Full Price	Savings	% Reduction
Bread	$2.29	$0.30	13%
